Mineral content in water varies from place to place. Depending on the mineral content of the water in your area, calcium deposits or scale may build up in your Brewer. Though scale is non-toxic, it can hinder Brewer performance. De-scaling your Brewer will help maintain the heating element and other Brewer parts that come in contact with water. For optimal performance, de-scale your Brewer every 3 to 6 months. It is possible for calcium deposits to build up faster, making it necessary to de-scale more often. This Brewer is equipped with sensors to detect when scale buildup is interfering with the performance of the Brewer. When this is detected, DE-SCALE will be displayed on the control panel (see figure 30), at which point you should promptly de-scale. However, even if DE-SCALE is not displayed, it is still advisable that you de-scale your Brewer regularly. figure 30 Note: Though the Brewer will continue to function even when DE-SCALE is displayed, not de-scaling at that point could damage the Brewer. If this occurs, DE-SCALE will begin to flash on the control panel to alert you to potential damage if you do not de-scale immediately. 20 Follow these steps to de-scale your unit: 1. Empty the reservoir. 2. Disable the AUTO OFF and OFF TIME features. 3. Making sure there is no K-Cup in the brewing chamber, fill the reservoir with 60 oz. of undiluted white vinegar. 4. Place a large mug on the drip tray and run a Hot Water cycle. Select the 12 oz. brew size. Discard contents of mug. 5. Repeat the hot water process until ADD WATER is displayed on the control panel and the reservoir lights will flash. 6. Let the Brewer stand for at least four hours while still on. 7. Rinse the water reservoir thoroughly and fill with fresh water. 8. Run another Hot Water cycle. Discard contents of large mug. 9. Repeat hot water process until ADD WATER is displayed on the control panel and the reservoir lights will flash. 10. You may need to perform additional Hot Water cycles if you detect any residual vinegar taste. Note: If DE-SCALE is still displayed on the control panel after completing the procedure, repeat the de-scaling procedure above. The automated system could also go a long way to save you time. Make sure this button is working and the rinse is always done after the brewing and not before. If it is done before you could get lesser serving since the water is used. This could explain a short drop in any of the runs.Auto vs. ManualThe machine is designed for automation. Do not cut short programmed times manually. This could interrupt the normal operations in the coffeemaker. If you chose to do things manually, do it to the end. If you chose to set the timer, let it work till the set end. Interrupting the machine by removing parts and manually stopping it could develop long term complications in the system. If this happens, you can reset the sensor by removing and replacing the water reservoir which works like magic.Dispense some Water out of the SS700Dispense some water through the machine without making coffee first. This hot water will also serve the purpose of warming your mug, which is a good thing. Make sure you put in a few extra oz to make sure you get your usual mug count. This will also help but is temporal. It should be able to reset the machine for you effectively. This works mostly when you are having short drops in your cup.Replace the Water ReservoirThis is the most recommended method by the manufacturers. It seems to work for any complication that has come. Most of the complications come with the tampering of the sensor system. The sensor system can be reset manually by replacing the water reservoir system and putting another one. This will work wonders. Try to remove and put it back and see how the system respo Use a Professionalnds for you. The sensor has been designed to reset every time this part of the coffee maker is replaced or removed for whatever purpose.You also need to get in touch with the professionals or also use your warranty in the case of damage. You can get the whole thing replaced or also get it looked at by a professional. It also could be an electrical problem or mechanical problem due to a disconnection or power failure. For this reason, any coffee maker, kettle, or other water-using appliance you may have in your kitchen to brew coffee will need to be de-scaled of calcification from time to time. That is true of appliances ranging from old-fashioned stovetop coffee pots and tea kettles to modern coffee makers. Rest assured, you can modify the steps presented here to suit any size coffee maker in any setting. Follow the steps below on this page to remove calcium deposits from your coffee maker’s mechanisms. If the “clean” or “de-scale” light continues to flash after you have done so, repeat the steps. You may need to clean your coffee maker two or three times if you have neglected regular cleaning. Descale Cuisinart Single Serve: Nozzle Pay close attention to the nozzle where the coffee comes out. Keeping this area clean will prevent calcium scale buildup around the nozzle. This could interfere with the delivery of coffee to your carafe or cup and could cause a messy accident. Wipe down the exterior of the machine with a soft, soapy cloth or kitchen sponge. Follow up with a cloth or sponge soaked in clean water and wipe dry. More Coffee Maker Descaling See: How To Descale A Keurig After following these steps, your appliance should be free of calcium scale and vinegar taste. If you do still smell or taste the vinegar, run your machine with clean water again. This should take care of your Cuisinart coffee maker problem. You can use these basic instructions to remove calcium scale from any appliance that uses water. Tips For Best Results Use a mixture of two-thirds water and one-third white vinegar. Some instructions will tell you to use pure vinegar, but this is unnecessary. White vinegar is a very powerful natural cleaning agent, and it will work very well in diluted form. There is no need to be wasteful or to drive yourself out of the house with the smell of boiling vinegar. Be sure to use pure filtered water throughout the de-scaling process. It stands to reason that if you simply use tap water for this process, you will be introducing minerals as you remove them. Dramatic contrast in temperature is dangerous when handling glass. While cleaning your coffee maker, your glass carafe will get hot. Remember not to rinse it with cold water because this might cause it to shatter. Always use warm water to clean hot or warm glass and cool water to clean cold glass. Always remember to remove coffee grounds and filters from your coffee maker before performing the cleaning process. Dispose of your coffee grounds immediately after making coffee to avoid having mold develop. SEE ALSO: Coffee Maker Mold Is Making You Sick Remember that coffee grounds make an excellent addition to compost bins. They can also be used directly as plant food for potted plants and outdoor plants from time to time. Get double duty from your hot vinegar water by using it to clean your microwave. Just pour the hot mixture into a microwave-safe cup or bowl and microwave it for a few seconds to get it steaming. Don’t open the microwave door. Just leave it shut for five or ten minutes. When you open it, you will find that the vinegary steam has collected on all surfaces. Wipe it off, along with collected grime and spatters, using a cleaning cloth dipped in hot water and wrung nearly dry. Remember to pour the hot vinegar water directly into your kitchen sink drain when you’re done with it. Hot vinegar water will cut through any grease deposits that may be in your drain pipe and helps keep your drains from clogging. Start With Prevention All water has some minerals, but you can mitigate the mineral content of your tap water by using a good filtration system. This could be a whole house system, a kitchen faucet filter, or an affordable filtration pitcher. Whatever you do, be sure to make the smart choice of filtering your own tap water rather than purchasing bottled water. You’ll be doing the earth, your pocketbook, and your own health a very big favor by making this wise decision. Tap Water Filter System A good tap water filtration system will deliver superior quality water with reduced mineral content for a fraction of the cost of stale, and carcinogen laced bottled water. Even when you use high quality filtered water, you will need to de-scale your Cuisinart coffee maker on a regular basis. Some purveyors of online advice recommend doing this every three months or waiting until the “clean“ or “de-scale“ light comes on before taking action. Common kitchen wisdom dictates that you take a proactive stance and de-scale your water-using appliances and equipment about once a month, especially if you use the appliance every day. Of course, if you only use an appliance occasionally, you should adjust your maintenance schedule accordingly. Even with appliances you use daily, you are unlikely to have a lot of calcification buildup in just a month’s time, but de-scaling frequently will prevent calcium buildup and help keep your Cuisinart coffee maker and your other appliances in excellent working order.
